

ISS 2026 AI Hackathon Track 1: AI-Assisted Infectious Disease Screening Problem Statement

Background

Early screening of infectious diseases remains a major challenge in resource-limited settings. Timely identification of likely infections can improve triage, clinical decision-making, and patient outcomes.

Challenge

Develop an AI or machine learning model that predicts the most likely infectious disease using the provided synthetic patient dataset. Teams should demonstrate appropriate preprocessing, feature engineering, model development, evaluation, and interpretation.

Dataset

The provided dataset contains synthetic Nigerian patient records with demographic information, symptoms, vital signs, laboratory findings, epidemiological risk factors, and a target diagnosis.

Expected Deliverables

Submit a public GitHub repository, technical report (maximum five pages), presentation slides, and a demonstration video (maximum five minutes).

Evaluation Focus

Solutions will be assessed on model performance, explainability, innovation, public health relevance, and technical presentation.
