

ISS 2026 AI Hackathon Track 3: AI for Climate and Environmental Health Problem Statement

Background

Climate and environmental factors influence many public health outcomes. Integrating open climate, environmental, and demographic data can support predictive public health decision-making.

Challenge

Develop an AI solution that integrates publicly available datasets to predict or assess a climate-sensitive public health problem in Nigeria, such as malaria risk, cholera vulnerability, flood risk, or heat stress.

Data Sources

Participants should obtain and integrate data from the official sources provided in the Data Acquisition Guide, including NASA POWER, CHIRPS, WorldPop, OpenStreetMap, SRTM, and optional MODIS datasets.

Expected Deliverables

Submit a public GitHub repository, technical report (maximum five pages), presentation slides, and a demonstration video (maximum five minutes).

Evaluation Focus

Solutions will be assessed on data acquisition, preprocessing, feature engineering, model performance, explainability, innovation, and public health impact.
